Report Overview

Real-time fluorescent PCR is a method of measuring the total amount of product after each cycle of polymerase chain reaction (PCR) with a fluorescent chemical substance in a DNA amplification reaction. Real-time fluorescent PCR is highly automated, highly specific, and highly sensitive, but it can only perform relative quantification, not absolute quantification. Digital PCR is an absolute quantification technology for nucleic acid molecules. Compared with real-time fluorescent PCR, digital PCR allows you to directly count the number of DNA molecules, which is the absolute quantification of the starting sample. Digital PCR can achieve accurate absolute quantification and high sensitivity, but the cost of the detection system is high, the throughput is limited, and the operation is cumbersome.
