Report Overview

Real-time LAMP (Loop-mediated Isothermal Amplification) tester is a diagnostic tool used for the detection of specific nucleic acid sequences, such as DNA or RNA, in a biological sample. LAMP is an isothermal amplification technique that allows for rapid and sensitive amplification of target nucleic acids at a constant temperature without the need for complex thermal cycling.

The real-time LAMP tester combines the LAMP amplification method with real-time fluorescence detection. During the LAMP reaction, if the target nucleic acid sequence is present in the sample, it will be amplified exponentially. The real-time LAMP tester monitors this amplification process in real-time by measuring the fluorescence signal generated as a result of the amplification. This enables quantification of the target nucleic acid and provides information about its presence or absence in the sample.

The real-time LAMP tester is commonly used in fields such as medical diagnostics, infectious disease detection, food safety testing, and environmental monitoring. It offers advantages such as rapid results, high sensitivity, and simplicity of operation compared to other nucleic acid amplification methods.
