Report Overview:

Real-Time PCR has become an increasingly popular technique for analysis of gene expression. There are two primary methods of real-time PCR that can be performed. The first involves including the reverse transcriptase step in the same tube as the PCR reaction (one-step). The second method involves creating cDNA first by means of a separate reverse transcription reaction and then adding the cDNA to the PCR reaction (two-step). There are advantages and disadvantages to both systems that you should consider before choosing the best one for your application, these include the ease of use and cost of reaction to the resulting yield and sequence representation. One-step reactions are certainly easier to set up with less overall hands-on time, but do not provide the flexibility and control that is possible with two-step reactions.

The Global Real Time PCR Kits Market Size was estimated at USD 2750.18 million in 2023 and is projected to reach USD 4197.20 million by 2029, exhibiting a CAGR of 7.30% during the forecast period.
