Abstracts

The rear axle steering system is a sophisticated automotive technology that enables controlled steering of the rear wheels, either in-phase (same direction as the front wheels) or counter-phase (opposite direction), to enhance vehicle dynamics, stability, and maneuverability. By adjusting the rear wheel angle in response to steering input, vehicle speed, and driving conditions, this system reduces the turning radius at low speeds for improved agility in urban environments and parking scenarios, while increasing stability and responsiveness at higher speeds, particularly during lane changes and cornering. Primarily integrated into premium passenger vehicles, high-performance sports cars, and some luxury SUVs, the system relies on electro-hydraulic or fully electric actuators, sensors, and electronic control units, working in conjunction with other chassis systems like electronic stability control to deliver a balance of comfort, safety, and driving precision.

The global Rear Axle Steering System market size was estimated at USD 1290.45 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 10.80% during the forecast period.
