### Report Overview:

Non Destructive Testing (NDT) methods are popular for routine inspection of bridge members. With the ability of new highly technical systems, some of these NDT techniques can be used for reinforcing steel rebar location in concrete bridge decks without destruction of the members being tested. Use of these techniques has the ability to minimize traffic restrictions related to field data collection and to improve design and asset management.

Rebar detector is one of the NDT, which are used to locate the steel bar embedded in concrete before drilling and before taking core test.

It is the easiest and fastest ways for detecting reinforcing bar in concrete. It is widely used before coring or drilling holes to find “safe spots”.

It will indicate rebar location, direction and also will give an indication of the depth of concrete cover.

The Global Rebar Detector Market Size was estimated at USD 125.09 million in 2023 and is projected to reach USD 163.84 million by 2029, exhibiting a CAGR of 4.60% during the forecast period.
