Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Recirculating Ball Type Mechanical Steering Gear competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global production of recirculating ball mechanical steering gears reached 7.0021 million units, with an average selling price of US\$75 per unit. The annual production capacity of a single production line for recirculating ball mechanical steering gears is approximately 600,000 units, with a gross profit margin of approximately 18.43%. A recirculating ball mechanical steering gear is a component of the automotive steering system, primarily consisting of a screw, nut, steering gear housing, and numerous small steel balls. These small steel balls are placed in a sealed tube between the nut and screw, converting the sliding friction between the nut and screw into rolling friction with less resistance. When the steering wheel turns, the screw pushes the nut up and down, which, via gears, drives the steering rocker arm back and forth, thus achieving steering. This design improves transmission efficiency and makes operation easier and more comfortable. The upstream raw materials for recirculating ball mechanical steering gears include metal materials, surface treatment materials, and control and transmission component materials. The midstream is comprised of recirculating ball mechanical steering gear manufacturers, while the downstream market is primarily concentrated in the commercial vehicle and passenger vehicle industries.

The global Recirculating Ball Type Mechanical Steering Gear market size was estimated at USD 525.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.40% during the forecast period.
