Abstracts

Recombinant carboxypeptidase B is an enzyme obtained through genetic engineering technology. The gene of recombinant carboxypeptidase B usually comes from organisms in nature, such as *Escherichia coli* or *Pichia pastoris*. Through cloning, expression and purification, the recombinant carboxypeptidase B is separated and purified from recombinant *Pichia pastoris* or *Escherichia coli*, and then freeze-dried to obtain the lyophilized powder of recombinant carboxypeptidase B. Recombinant carboxypeptidase B belongs to the metallo-carboxypeptidase family, and each molecule contains one Zn atom. It has the ability to specifically hydrolyze the amino end of the C-terminal basic amino acids of proteins (such as lysine, arginine, and histidine). This characteristic makes it have a wide range of application potential in protein sequence analysis, modification, and peptide synthesis. The activity of recombinant CPB is inhibited by typical metal chelators such as EDTA, and Cu²⁺ and Hg²⁺. Metal ions such as Zn²⁺ and Mn²⁺ can increase the enzyme activity to varying degrees. The optimal pH of CPB is 8.0. Acidic or alkaline conditions will cause a decrease in activity. When the pH is close to 5.0, the activity is close to zero, and when the pH > 12.0, the activity is completely lost. Within a certain temperature range (
