Report Overview

Recombinant Coagulation Factor IX is a biotechnologically engineered protein that plays a crucial role in blood clotting. It is used to treat hemophilia B, a genetic bleeding disorder caused by a deficiency of Factor IX. Recombinant Factor IX is produced in cell cultures using recombinant DNA technology, ensuring a safer and more consistent supply compared to plasma-derived products. This product is administered intravenously to patients with hemophilia B to control and prevent bleeding episodes, manage surgical procedures, and improve their quality of life. Recombinant Coagulation Factor IX has revolutionized the treatment of hemophilia B by providing a more reliable and effective therapeutic option for patients.

The market for Recombinant Coagulation Factor IX is experiencing steady growth driven by several key factors.
