Abstracts

Recombinant collagen refers to the use of recombinant DNA technology to genetically manipulate and (or) modify the genes encoding the desired human collagen protein, and use plasmids or viral vectors to bring the target gene into appropriate host cells (bacteria, yeast or other eukaryotic cells, etc.), express and translate it into collagen or collagen-like polypeptides, and then prepare it through extraction and purification. The use of biosynthesis technology to prepare recombinant collagen can overcome the disadvantages of animal-derived collagen, such as high immunogenicity and viral risks.
