Abstracts

Recombinant Factor C (rFC) Assay is an in vitro analytical method used for the detection and quantification of bacterial endotoxins, primarily serving as a replacement for the traditional Limulus Amebocyte Lysate (LAL) test derived from horseshoe crab blood. It utilizes a recombinant version of Factor C?a key protein in the horseshoe crab?s innate immune response?which is produced through biotechnology processes, offering a synthetic, animal-free, and more sustainable alternative for endotoxin testing in pharmaceuticals, medical devices, and biotechnology products. The assay operates based on a fluorescence or colorimetric enzymatic reaction that is triggered specifically by endotoxins, providing high sensitivity, reproducibility, and reduced risk of batch-to-batch variability, making it particularly valuable in quality control and regulatory compliance within sterile manufacturing environments.

The global Recombinant Factor C Assay market size was estimated at USD 135.42 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.85% during the forecast period.
