## Abstracts

GM-CSF is a cytokine that belongs to the colony stimulating factor family. It plays an important role in immune regulation, hematopoiesis and inflammation. GM-CSF is mainly produced by a variety of cells, including macrophages, T cells, B cells and fibroblasts. It can stimulate the proliferation, differentiation and functional activation of granulocytes and monocytes in the hematopoietic cell series. GM-CSF can promote the differentiation of multipotent stem cells in the bone marrow into granulocytes and monocytes, increase the number of white blood cells, and improve their function, thereby enhancing the body's immune response and anti-infection ability. In addition, GM-CSF also has an important regulatory effect on the activation and antimicrobial activity of macrophages and dendritic cells. In clinical practice, GM-CSF is widely used to treat bone marrow transplant-related complications, malignant tumors, and immunodeficiency diseases. It is also used as a tool in laboratory research to explore the regulatory mechanisms of the hematopoiesis and immune systems and to develop new therapeutic strategies.

The global Recombinant Human GM-CSF Protein market size was estimated at USD 48.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.50% during the forecast period.
