## Abstracts

Recombinant human transforming growth factor-? is a biologically active protein produced by genetic engineering technology. It simulates the function of transforming growth factor-? naturally present in the human body and participates in regulating biological processes such as cell proliferation, differentiation and immune response. It is characterized by high specificity and activity, which can effectively promote cell growth and tissue repair; it has strong controllability during the production process and can be prepared on a large scale to meet clinical and scientific research needs; at the same time, due to its recombinant nature, it avoids the potential risks of animal-derived products. The advantage is that rh-TGF-? provides a new biological drug for clinical treatment, which is used to promote wound healing, treat inflammation and certain diseases, and has important medical value and broad application prospects.

The global Recombinant Human Transforming Growth Factor-? market size was estimated at USD 1639.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.90% during the forecast period.
