Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Recombinant Humanized Collagen competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Recombinant humanized collagen refers to the introduction of collagen sequences encoded by human genes into cells for expression and production through gene recombination technology to obtain proteins with the same or similar structural and biological characteristics as natural collagen. Recombinant humanized collagen has many advantages, such as controllable production process, high purity, non-infectiousness, etc. It has a wide range of application prospects in medicine, biotechnology, cosmetics and other fields. Recombinant humanized collagen can be used as a biological material in tissue repair and regenerative medicine, including muscles, bones, soft tissues, etc. In addition, it can also be used as a drug carrier for sustained-release drugs, such as heparin, thiazolidinone, etc., to improve the stability and bioavailability of the drug. At the same time, it can also be used to produce medical devices and medical materials such as artificial skin and artificial cornea. Recombinant humanized collagen can be used in cell culture, gene transfection, vaccine production and other aspects. It can act as a scaffold or matrix in cell culture and gene transfection, improve cell adhesion and proliferation, and promote the development of tissue engineering and stem cell research. In terms of vaccine production, recombinant humanized collagen can be used as a vaccine carrier to improve the immunogenicity and efficacy of the vaccine. Recombinant humanized collagen can be used as an ingredient for efficient anti-wrinkle, moisturizing and skin repair, and is widely used in skin care products, makeup and other products. Recombinant humanized collagen has the same amino acid sequence and tertiary structure as natural collagen, which can act directly on the skin, promote the regeneration and repair of skin cells, and improve the

elasticity and gloss of the skin. The Medical Device Standard Management Center of the State Food and Drug Administration issued an interpretation of the "Guiding Principles for the Naming of Recombinant Collagen Biomaterials", which divides recombinant humanized collagen into two types, type A and type B based on whether it contains non-human collagen amino acid sequences. Type A refers to materials that do not contain non-human collagen amino acid sequences, including full-length amino acid sequences encoded by human collagen specific type genes (without triple helical structure), or partial amino acid sequence fragments encoded by human collagen specific type genes, or a combination of human collagen functional fragments (the amino acid sequences do not contain non-human collagen amino acid sequences such as linking amino acids and tag amino acids). Type B refers to the material that adds non-human collagen amino acid sequences such as amino acids and tag amino acids based on the combination of human collagen functional fragments. Compared with animal-derived collagen, recombinant collagen has a series of obvious advantages, including higher biological activity and biocompatibility, lower immunogenicity, lower risk of missed pathogens, better water solubility, non-cytotoxicity, and can be further processed and optimized. In addition, the denaturing temperature of recombinant collagen exceeds 72°C, which is much higher than 40°C for animal-derived collagen, which makes it more stable during transportation and storage. Therefore, as a safer material, recombinant collagen is more suitable for beauty and health products. With the advancement of the industry and the development of technology, its popularity and market penetration are gradually increasing. According to the "Guiding Principles for the Naming of Recombinant Collagen Biomaterials", recombinant collagen is divided into three main categories: recombinant human collagen, recombinant humanized collagen and recombinant collagen. The core differences in these three types of recombinant collagen are reflected in the construction of expression systems, host selection, protein expression, etc. As the homology and similarity of gene sequences increases, the expression efficiency and biological activity function of collagen vectors will also be improved accordingly.

The global Recombinant Humanized Collagen market size was estimated at USD 61.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 68.10% during the forecast period.
