Abstracts

A recombinant peptide therapy is produced through recombinant DNA technology. This involves inserting the DNA encoding the peptide into bacterial or mammalian cells, expressing the peptide in these cells and then purifying it from them. According to the "Global Use of Medicines 2023" released by IQVIA Institute, global pharmaceutical expenditures in 2022 will be approximately US\$1.48 trillion (excluding costs related to COVID vaccines and therapies), and are forecast to grow at a rate of 3%-6% in the next few years. In terms of regional development trends, high-income countries such as Western Europe, North America and Japan are expected to grow at a slower rate in the next few years due to already high per capita usage, while growth markets such as Asia, Latin America and Eastern Europe will grow strongly. In terms of drug spending, China's drug spending in 2022 will be approximately US\$166 billion. It is expected that drug expenditures will only increase in the next few years: from the perspective of demand, the trend of population aging, the increase in residents' wealth and the improvement of health awareness will drive the demand for drugs; from the perspective of national strategy, in 2016, the State Council issued the "Healthy China 2030" Planning Outline, and "Healthy China" has been elevated to a national strategy; from the perspective of industry policies, it has experienced the uncertainty caused by the early stage of pharmaceutical reform, the implementation of centralized procurement policies and the revision of the drug reimbursement catalog. The update will gradually achieve a dynamic balance with multiple goals such as promoting innovation, stabilizing supply, and reducing the burden on the public.

The global Recombinant Peptide market size was estimated at USD 478.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.60% during the forecast period.
