### Report Overview:

In fiber optics, a reconfigurable optical add-drop multiplexer (ROADM) is a form of optical add-drop multiplexer that adds the ability to remotely switch traffic from a wavelength-division multiplexing (WDM) system at the wavelength layer. This is achieved through the use of a wavelength selective switching module. This allows individual or multiple wavelengths carrying data channels to be added and/or dropped from a transport fiber without the need to convert the signals on all of the WDM channels to electronic signals and back again to optical signals.

The Global Reconfigurable Optical Wavelength Division Multiplexer Market Size was estimated at USD 163.61 million in 2023 and is projected to reach USD 221.76 million by 2029, exhibiting a CAGR of 5.20% during the forecast period.
