Abstracts

Recrystallized silicon carbide ceramics are blanks made by grading silicon carbide particles of different particle sizes in a columnar shape. The fine particles of the grains in the blank can be evenly distributed between the coarse particle pores, and then flow under high temperatures above 2100°C and certain airflow protection. The fine silicon carbide particles gradually precipitate at the contact points after evaporation and condensation until the fine particles completely disappear. Due to this evaporation-condensation mechanism, new grain boundaries are formed at the neck of the particles, resulting in the migration of fine particles and the formation of a bridge structure between large particles and a sintered body with a certain porosity. The advantage is that the ceramic material does not require any sintering aids during the sintering process, and the sintered body is a single crystal silicon phase with excellent anti-oxidation properties.

Driving Factors: Excellent product performance Silicon carbide ceramics have excellent properties such as oxidation resistance, high temperature strength, chemical stability, thermal shock resistance, thermal conductivity and good air tightness. There are almost no substitutes on the market that can easily replace silicon carbide ceramics.

Huge market demand Silicon carbide ceramics are widely used, with a huge market size and rigid demand.

Technological progress drive With the increase of market entrants, related R&D investment will also increase simultaneously, and will further promote technological progress and industry development.

Restrictive Factors: Market access barriers Downstream industries generally do not easily change suppliers. Many companies maintain long-term and stable cooperative relationships. New entrants are difficult to achieve rapid development in the industry without certification of high-quality customers in related industries.

Technology and experience barriers Silicon carbide ceramics have very high technical requirements. The rapid development of downstream pan-semiconductor and other industries has made related technology iterations very rapid. Personnel experience and proficiency in the operation

of production equipment will also affect the manufacturing level of enterprises. Enterprises need to accumulate relevant technologies and experience in mass production practices for a long time, and understand customer needs in a timely manner to continuously improve related formulas and production processes. Capital and scale barriers In order to maintain the leading technology and market competitiveness of products, silicon carbide ceramic companies need to continue to invest in research and development, which requires a large amount of capital. In the initial stage, companies need to invest a lot of money in factory construction and purchase of production equipment, and give full play to the scale effect of production through reasonable and scientific scheduling of production shifts. Due to the large number of models of ceramic material parts, the specific applications and performance requirements are different, and new products face the risk of R&D failure. Without sufficient financial support, it is difficult for new entrants to develop mature products and form a certain scale of operation, and they cannot compete effectively with existing companies in the industry.

The global Recrystallized Silicon Carbide Ceramics market size was estimated at USD 609.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
