Abstracts

A ?rectangular waveguide? is a metal pipe used to transmit electromagnetic waves, usually made of copper or aluminum and constructed of metal walls with a rectangular cross-section. The working principle of rectangular waveguide is based on the propagation characteristics of electromagnetic waves in conductors. When an electromagnetic wave enters one port of a waveguide, it reflects and propagates inside the metal wall. The size and shape of the waveguide determines its operating frequency range and transmission characteristics. It is widely used in microwave and millimeter wave fields, especially in wireless communication systems, radar systems, satellite communications and other fields. ?Rectangular waveguides also have limitations such as large size, transmission loss, and mode distortion. Relevant companies are constantly improving and innovating.

The global Rectangular Waveguide market size was estimated at USD 562.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.90% during the forecast period.
