Abstracts

Recuperative oxidizers are air pollution control systems designed to destroy volatile organic compounds (VOCs) and hazardous air pollutants (HAPs) from industrial exhaust streams through high-temperature thermal oxidation, utilizing a primary heat exchanger to preheat incoming contaminated air by recovering heat from the cleaned exhaust gas. This design significantly improves thermal efficiency and reduces fuel consumption compared to non-recuperative systems, as the heat exchanger is typically constructed from materials resistant to high temperatures and corrosion, such as stainless steel or specialty alloys, enabling the system to operate at lower operating costs while achieving the high destruction efficiency rates (often exceeding 99%) required by environmental regulations. By recovering and reusing thermal energy, recuperative oxidizers are particularly suited for applications with moderate to high VOC concentrations where energy savings are a priority, though they may be less effective than regenerative thermal oxidizers (RTOs) in handling very low concentration streams or those with particulates that could foul the heat exchanger.

The global Recuperative Oxidizers market size was estimated at USD 150.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.75% during the forecast period.
