Abstracts

Cobalt is a strategic metal and an important raw material for the production of anti-corrosion alloys, heat-resistant alloys, magnetic alloys, and hard alloys. Regenerated cobalt refers to the repurification and processing of waste cobalt through a series of treatments to make it reusable. Regenerated cobalt has the advantages of low production cost, environmental protection, and simple production process, and has broad application prospects in the fields of batteries, cobalt alloys, and cobalt magnetic materials. In 2016, Amnesty International, a US human rights organization, claimed that some companies, including Apple, Samsung Electronics, Sony, and Microsoft, purchased cobalt from producers who used minors to mine cobalt, which brought huge negative impacts to technology companies. Since then, a large number of technology companies have begun to make their supply chains transparent to verify that the cobalt they use comes from regular manufacturers. Recycled cobalt has received a lot of attention due to its completely green production. Apple announced that by 2025, all Apple-designed batteries will use 100% recycled cobalt. At the same time, with the rapid expansion of the electric vehicle (EV) industry, especially in the context of the global transition to renewable energy, the demand for cobalt as a key material in lithium-ion batteries has increased significantly. The application of recycled cobalt can effectively alleviate the problems of supply chain tension and insufficient cobalt resources in China. In 2019, the global production of recycled cobalt was about 16,460 metric tons, of which cobalt from lithium battery waste accounted for 68.61%. It is estimated that in 2030, the global production of recycled cobalt will be 98,324 metric tons, with a compound annual growth rate of 9.86% from 2024 to 2030.

The global Recycled Cobalt market size was estimated at USD 1580.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 12.70% during the forecast period.
