Abstracts

Recycled polyester sneakers are athletic or casual footwear constructed primarily from polyester fibers derived from post-consumer plastic waste, such as PET bottles, which undergo a process of cleaning, shredding, melting, and extrusion into new yarn. This regenerated material is then engineered into uppers, linings, laces, and other components, offering comparable durability, moisture-wicking properties, and lightweight performance to virgin polyester while significantly reducing environmental impact by diverting plastic from landfills and oceans and lowering energy consumption and carbon emissions during production. The product represents a tangible intersection of sustainability and functionality within the footwear industry, appealing to eco-conscious consumers seeking style without compromising on environmental ethics.

The global Recycled Polyester Sneakers market size was estimated at USD 1280.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.80% during the forecast period.
