Abstracts

Polyethylene terephthalate, commonly referred to as PET or polyester resin, is a versatile condensation polymer synthesized from terephthalic acid and ethylene glycol. Its inherent durability, clarity, and resistance to moisture make it an ideal material for a wide range of applications. When PET is collected from used bottles and various forms of post-consumer waste, it undergoes a series of recycling processes to produce what is known as recycled polyester. This reprocessed material retains many of the beneficial properties of virgin PET while contributing to environmental sustainability by reducing waste and conserving resources. The recycling process not only helps in managing plastic waste more effectively but also supports the broader movement towards a circular economy. By transforming discarded PET into valuable raw material, recycled polyester serves as a critical component in various industries, simultaneously addressing environmental concerns and meeting the demand for high-performance polymers.

The global Recycled Polyethylene Terephthalate Pet market size was estimated at USD 13370.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.90% during the forecast period.
