Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Recycled TPEs competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global Recycled TPEs production reached approximately 1,578.95 kilotons with an average global market price of around US\$950 per ton. Single-line annual production capacity averages 42 kilotons, with a gross margin of approximately 20%. The upstream of Recycled TPEs is primarily concentrated in the waste recycling and reprocessing sector, with the midstream involving the conversion of recycled materials into TPE products. Approximately 50% of these products are used in the manufacture of automotive components, about 30% in the production of consumer goods, and the remaining 20% is distributed across other sectors such as construction and medical applications. Recycled TPEs are thermoplastic elastomers that have been processed from post-consumer or post-industrial waste materials. These materials are carefully sorted, cleaned, and reprocessed to create a product that retains the desired elastomeric properties of TPEs while significantly reducing environmental impact. The reclamation and reuse of TPEs contribute to a circular economy by decreasing the demand for virgin materials and lowering the amount of waste that ends up in landfills. Recycled TPEs can be tailored to meet specific performance requirements and are compatible with various manufacturing processes, making them a sustainable alternative for a wide range of applications.

The global Recycled TPEs market size was estimated at USD 1500.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.60% during the forecast period.
