Abstracts

The redundant robot, specifically the 7-axis robot, is an industrial robotic manipulator characterized by an extra degree of freedom beyond the six axes typically required for full spatial positioning and orientation, which enables enhanced dexterity, improved obstacle avoidance, and greater flexibility in complex or confined workspaces where standard robots may face kinematic limitations or singularities. This redundancy allows the robot to reconfigure its posture without altering the end-effector's position, making it particularly valuable in applications requiring intricate motion paths, human-robot collaboration, or tasks in unstructured environments such as assembly, welding, inspection, or material handling where adaptability and precision are critical.

The global Redundant Robot (7 Axis) market size was estimated at USD 1750.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 12.80% during the forecast period.
