Abstracts

Reef-friendly sunscreen is a specialized form of sun protection product crafted with the well-being of coral reefs in mind. It is formulated without certain chemicals, most notably oxybenzone and octinoxate, which have been demonstrated to cause significant harm to coral reef ecosystems. These chemicals can interfere with coral's normal biological processes, leading to bleaching, reduced growth, and even death. Instead, reef-friendly sunscreens typically use natural, non-toxic active ingredients such as zinc oxide or titanium dioxide. These substances physically scatter and reflect ultraviolet (UV) rays, safeguarding the skin from harmful UV radiation while minimizing the negative impact on the delicate marine habitats that coral reefs support.

The global Reef-friendly Sunscreen market size was estimated at USD 1127.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
