Abstracts

Refined EMM (Electrolytic Manganese Metal) is a type of electrolytic manganese, which is a refined manganese product created through the purification and electrolysis of a manganese-rich solution that is made by dissolving manganese carbonate ore or calcined manganese oxide ore. EMM (Electrolytic Manganese Metal) is used in alloy steels and non-ferrous metal alloys for a wide range of applications. Manganese plays the role of deoxidation, desulfurization and alloying in the steel making process. Manganese in the alloy can increase the strength, toughness, wear resistance and corrosion resistance of the alloy. Due to its high purity and low impurity content, EMM has been successfully used in iron and steel metallurgy, non-ferrous metallurgy, electronics, welding, aerospace and other fields. North America occupies a considerable market share. North American industry is characterized by deep market expertise, technologically advanced manufacturing bases, and, most importantly, large end-user markets. This market aims to expand the market through increased investments and activities in battery-level production and increased product adoption by leading battery manufacturers. Latin America is likely to experience growth due to expanded government programs and restrictions. The Middle East and Africa show slow growth due to replacement.

The global Refined EMM (Electrolytic Manganese Metal) market size was estimated at USD 2347.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
