Abstracts

Reflective bistable cholesteric liquid crystal display is a display developed using the bistable characteristics of cholesteric liquid crystal. Cholesteric liquid crystal has two stable texture states: planar texture (p state) and focal conic texture (fc state). Both states can exist stably in the absence of an external electric field. In the p state, if the wavelength of the incident light matches the pitch, the light will be reflected and the reflected light will be circularly polarized light; in the fc state, the pitch distribution is disordered, and the light is scattered. Under the action of an external electric field, these two states can switch between each other to achieve the display function. Reflective bistable cholesteric liquid crystal display is particularly suitable for e-books, electronic curtains, commercial advertisements and other fields that require long-term display and low power consumption. In addition, due to its simple structure, easy manufacturing and low cost, it also has broad application prospects.

The global Reflective Bistable Cholesteric Liquid Crystal Display market size was estimated at USD 48.8 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 24.20% during the forecast period.
