Abstracts

A reflective optical encoder is a type of rotary or linear position sensor that operates by reflecting light off a patterned surface, such as a code disk or strip, to detect motion, position, or speed changes; it consists of a light source, typically an LED, a patterned reticle or scale with alternating reflective and non-reflective segments, and a photodetector array that captures the reflected light, converting the optical signals into electrical pulses to provide high-resolution, non-contact feedback for applications requiring precision, such as robotics, industrial automation, medical devices, and consumer electronics like computer mice and printers, where its compact design, reliability, and resistance to environmental factors like dust and moisture offer advantages over transmissive encoders.

The global Reflective Optical Encoder market size was estimated at USD 1010.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.80% during the forecast period.
