## Abstracts

A refreshable braille display is an electronic device that enables individuals who are blind or visually impaired to read digital text by converting it into tactile braille output, typically through a series of pins that rise and fall to form braille characters in real time. These devices connect to computers, smartphones, or tablets and function as both an output device?displaying content line by line?and an input device, often incorporating braille keyboards or navigation controls for interaction. They are essential for accessing digital information, educational materials, and workplace documents, providing a critical bridge between digital content and braille literacy. The technology relies on electro-mechanical components, such as piezoelectric or electromagnetic cells, to dynamically refresh the braille cells as the user navigates through text.

The global Refreshable Braille Display market size was estimated at USD 70.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
