## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Refrigerated Centrifuge Rotor competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. The refrigerated centrifuge rotor is the core component of the refrigerated centrifuge. It is used to hold and rotate samples, and achieve sample separation through the centrifugal force generated by high-speed rotation in a low-temperature environment. It is usually made of metal materials (such as aluminum alloy, stainless steel, etc.), with high strength and corrosion resistance. According to the sample type and separation requirements, it can be divided into different types such as angle rotors and horizontal rotors. The centrifuge tube in the angle rotor is at a fixed angle with the shaft, which is suitable for high-speed centrifugation, can provide high centrifugal force, and can quickly collect sediments; when the horizontal rotor is running, the basket is in a horizontal state, and the sample sediment is concentrated at the bottom of the centrifuge tube, which is more suitable for chromatographic separation of larger volume samples.

The global Refrigerated Centrifuge Rotor market size was estimated at USD 172.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.80% during the forecast period.

This report offers a comprehensive and in-depth analysis of the global Refrigerated Centrifuge Rotor market, covering all critical facets from a broad macroeconomic overview to detailed micro-level insights.
