Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Refurbished Silicon Wafer competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Refurbished Silicon Wafers refer to previously used or discarded silicon wafers (such as test wafers, dummy wafers, or scrap wafers) that undergo a refurbishment process involving film strip, grinding, chemical-mechanical polishing (CMP), ultra-clean rinse, and quality inspection, so as to restore wafer surface quality, flatness, and cleanliness to meet standards suitable for semiconductor fabs? monitoring, equipment qualification, dummy runs, or yield verification tasks. These wafers are generally not used for final device production, but they provide process representativeness and functional equivalence to prime wafers in monitoring, calibration, and testing scenarios, enabling significant cost savings and resource reuse by avoiding the consumption of high-value new wafers. Based on multiple market research and industry statistics, the global refurbished silicon wafer market's annual shipments in 2024 were estimated to be between 150 million and 350 million wafers, with a weighted average mainstream ex-factory price of approximately US\$4 to US\$10 per wafer.

The global Refurbished Silicon Wafer market size was estimated at USD 720.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
