Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Refurbished SSD and HDD competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Refurbished SSD refers to the process of repairing a used or faulty SSD through a series of technical means to make it usable again. These technical means may include cleaning, replacing faulty parts, reprogramming, etc. Refurbished HDD refers to the process of repairing a used or faulty HDD through cleaning, replacing faulty parts, etc. to make it usable again. The process of refurbishing HDD may include replacing faulty parts such as heads and circuit boards, as well as comprehensive cleaning and testing of the hard drive. Refurbished SSD and HDD are usually cheaper and suitable for users with limited budgets. Refurbished storage devices can extend their life cycle and reduce electronic waste (especially metal in HDDs and flash memory chip contamination in SSDs). NAND flash memory in SSDs and disk/head materials in HDDs can be reused through refurbishment, reducing the need for raw material mining. The price of refurbished SSD/HDD is only 30%-50% of that of new products, suitable for budget-sensitive users (such as small and medium-sized enterprises and educational institutions). Data centers can expand cold storage or backup capacity through refurbished hard drives to reduce TCO (total cost of ownership). During periods of semiconductor shortages (such as SSD main control chips), refurbished equipment can alleviate supply gaps.

The global Refurbished SSD and HDD market size was estimated at USD 1538.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 9.70% during the forecast period.
