## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Refurbished Wafer competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Refurbished wafers refer to previously used or scrapped silicon wafers that have undergone a dedicated refurbishment process including film stripping, grinding, chemical mechanical polishing and ultra clean washing, in order to restore their surface quality, flatness and cleanliness to levels suitable for use in semiconductor fabs. These wafers are mainly deployed in process monitoring, equipment qualification, start up stabilization and dummy operations, rather than final device fabrication. Compared with using prime wafers for such auxiliary purposes, refurbished wafers can significantly reduce total wafer consumption while maintaining process representativeness, and therefore are a key element in circular material utilization for semiconductor manufacturing. In terms of appearance and form, refurbished wafers are very similar to new polished wafers. They are monocrystalline silicon wafers, predominantly in two hundred millimetre and three hundred millimetre diameters, with mirror like polished surfaces and defect or particle levels graded according to their specific uses. The substrate is still high purity monocrystalline silicon, and for certain products a thermally grown oxide layer is added after refurbishment to support film thickness and uniformity monitoring. By application, the market typically distinguishes between monitor refurbished wafers, dummy refurbished wafers and higher grade refurbished wafers that approach prime wafer specifications, serving logic fabs, memory fabs, power and compound semiconductor manufacturers as well as equipment makers across their testing and validation flows. Based on multiple market research and industry statistics, the global refurbished silicon wafer market's annual shipments in 2024 were estimated to be between 200 million and 500 million wafers, with a weighted average

mainstream ex-factory price of approximately US\$5 to US\$12 per wafer.

The global Refurbished Wafer market size was estimated at USD 1500.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.00% during the forecast period.
