Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Refuse Derived Fuel competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global Refuse Derived Fuel production reached approximately 7.93 M Tons, with an average global market price of around US\$ 63/Ton. The single-line production capacity is approximately 50,000-100,000 tons/year, and the industry gross profit margin is approximately 35%-45%. Labor is a significant component of costs, generally accounting for around 20%-30%. Raw material costs vary depending on their acquisition method and price, but typically range from 20% to 40%. Crushing, drying, and forming processes all require energy, and energy costs generally account for around 10%-20% of total costs. Refuse Derived Fuel refers to a solid renewable fuel with a certain shape and particle size that is made by separating and removing non-combustible components (such as metals, glass, bricks and stones) from various types of waste, including municipal solid waste, industrial solid waste, and agricultural waste, through a series of physical or chemical treatment processes such as sorting, crushing, magnetic separation, air separation, drying, and molding. The combustible components (such as waste plastics, waste paper, waste textiles, and wood waste) are extracted and further processed. Upstream raw material supplies primarily include municipal solid waste (RSW), industrial waste, and construction waste. In 2024, China's municipal solid waste collection volume reached 258 million tons, of which approximately 103 million tons, or about 40%, could be used as raw material for RDF production. Regarding industrial waste, the total amount of industrial waste used for SRF production reached 8.7 million tons in 2024, an 18.2% year-on-year increase, primarily from industries such as papermaking, textiles, and plastics processing. Downstream cement kiln co-processing is one of the primary uses of RDF, accounting for 74.6% of total RDF

consumption in 2024. Cement plants can partially replace coal using RDF, reducing fuel costs and carbon emissions.

The global Refuse Derived Fuel market size was estimated at USD 5163.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.20% during the forecast period.
