Abstracts

Refuse Derived Fuel (RDF) is a processed alternative fuel produced from non-hazardous municipal and commercial waste, typically through a series of mechanical treatments such as shredding, sorting, drying, and densification to remove recyclables, inert materials, and moisture. The resulting product consists of high-calorific-value combustible fractions?primarily plastics, paper, cardboard, textiles, and biodegradable organics?that can be utilized as a substitute for fossil fuels in energy-intensive industries like cement kilns, power plants, and industrial boilers. RDF is distinct from other waste-derived fuels due to its standardized quality parameters, including calorific value, moisture content, and chlorine levels, which are often regulated to ensure efficient combustion and compliance with environmental standards, thereby offering a sustainable waste management solution while contributing to energy recovery and circular economy objectives.

The global Refuse Derived Fuel (Rdf) market size was estimated at USD 2543.6 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
