Abstracts

Regenerated eco fibres, a subset of sustainable textiles, are materials derived from natural sources such as wood pulp (for viscose, lyocell, and modal), agricultural waste, or recycled fabrics through closed-loop manufacturing processes that minimize chemical use, energy consumption, and waste. These fibres are engineered to reduce dependence on virgin resources like petroleum (used in synthetics) or conventional cotton, offering biodegradable or recyclable alternatives that align with circular economy principles. Key examples include TENCEL (lyocell), made from sustainably sourced eucalyptus, and Refibra, which incorporates cotton scraps from garment production. The market for these fibres is driven by growing consumer awareness of environmental issues, stricter regulations on textile waste and pollution, and increasing commitments from fashion brands and retailers to adopt sustainable sourcing practices. Innovations in fibre technology such as the development of fibres from algae, orange peels, or coffee grounds continue to expand the category, while challenges remain around scalability, cost competitiveness compared to conventional fibres, and ensuring transparency in supply chains to verify sustainability claims. Geographically, Europe and North America lead in demand due to high eco-consciousness, though Asia-Pacific is emerging as a major production and consumption hub, supported by investments in green manufacturing and a rising middle class seeking sustainable products. The market is characterized by collaboration among fibre producers, fashion brands, and certification bodies to establish standards and promote adoption.

The global Regenerated Eco Fibres market size was estimated at USD 4215.6 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.50% during the forecast period.
