## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Regenerative Braking Resistor competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global annual sales of regenerative braking resistors are expected to reach approximately 3.5 million units, with an average unit price of around \$180. Regenerative braking resistors are energy-dissipating components designed specifically for motor drive systems and inverters. Their core function is to convert excess energy fed back to the DC bus during motor deceleration or braking into heat and safely dissipate it, thereby preventing damage to the equipment caused by excessive DC bus voltage. These resistors typically utilize high-power-density alloy wire or metal film resistors, coupled with a forced heat dissipation structure. They offer high reliability, high-temperature resistance, and fast response, making them suitable for operating conditions such as frequent braking and high-energy shocks. These products are widely used in CNC machine tools, port cranes, elevators, rail transit, and wind power grid-connected systems, playing a vital role in ensuring electrical system stability and extending the life of core equipment.

The global Regenerative Braking Resistor market size was estimated at USD 630.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.00% during the forecast period.
