Abstracts

Regenerative converter is a type of power converter that has the ability to convert energy from one form to another and store it in a battery or other energy storage device and the regenerative energy should be returned to the grid. It is designed to recover and reuse energy that would otherwise be wasted, making it highly energy efficient. The converter operates by taking the excess or unused energy from one system or load and feeding it back into the main power source or to an auxiliary load. This process not only reduces energy waste and improves overall system efficiency, but it also helps in reducing the overall power consumption and environmental impact. Regenerative converters have application in various fields, such as renewable energy systems, electric transportation, and industrial processes, where the ability to regenerate and reuse energy is crucial for optimal performance and sustainability.
