Abstracts

Regenerative power supplies (RPS) represent an advanced class of electronic test equipment designed to simulate various power sources while also recapturing and feeding energy back into the grid or local power system, rather than dissipating it as heat. Unlike traditional power supplies, which waste energy during testing of devices such as inverters, motors, or batteries, regenerative units convert excess DC power generated by the device under test back into AC power, offering significant improvements in energy efficiency, reduced operational costs, and minimized thermal output. These systems are characterized by their bidirectional power flow capability, precise voltage and current control, and often include features such as programmable load and source emulation, making them essential for applications demanding high efficiency, sustainability, and accurate power cycling tests in industries like renewable energy, automotive (especially electric vehicle development), aerospace, and industrial automation.

The global Regenerative Power Supplies market size was estimated at USD 1250.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.50% during the forecast period.
