Abstracts

Regulated charge pumps are integrated circuits that generate a stable output voltage from a lower input voltage by employing switched-capacitor topology, where capacitors are alternately charged and discharged in a controlled manner to achieve voltage multiplication or inversion without the use of magnetic components like inductors; these devices incorporate internal feedback and control circuitry to maintain tight regulation of the output voltage despite variations in input voltage, load current, or temperature, making them suitable for applications where size, cost, and electromagnetic interference (EMI) are critical constraints.

The global Regulated Charge Pumps market size was estimated at USD 350.42 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.15% during the forecast period.
