Abstracts

Reinforced Geosynthetic Clay Liners are a type of Geosynthetic Clay Liners (GCLs), which are factory-made hydraulic barriers consisting of a layer of bentonite or other very low-permeability material supported by geotextiles and/or geomembranes, mechanically held together by needling, stitching, or chemical adhesives. RGLs are GCLs that have additional reinforcement features, such as a scrim layer, a textured coating, or a geomembrane backing, to increase their internal and interface shear strength and stability. RGLs are suitable for moderate to steep slopes and moderate- to high-load applications, where conventional GCLs may not perform adequately.

The global Reinforced Geosynthetic Clay Liners market size was estimated at USD 285.45 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.65% during the forecast period.
