Abstracts

A Relative Analgesia Machine, also known as a nitrous oxide-oxygen sedation system, is a medical device designed to administer a controlled mixture of nitrous oxide (N2O) and oxygen (O2) to induce a state of conscious sedation in patients, primarily within dental, surgical, and medical settings. This apparatus allows the patient to remain awake, responsive, and cooperative while experiencing reduced anxiety, pain perception, and discomfort during procedures. Key components typically include precision flowmeters, a vaporizer or blender for gas mixture control, a scavenging system to minimize environmental exposure, and a delivery mechanism such as a nasal hood or mask. The machine operates by titrating the concentration of nitrous oxide (usually between 10% and 70%) balanced with oxygen to ensure patient safety and avoid hypoxia, providing a rapid-onset, easily adjustable, and reversible form of analgesia with minimal side effects.

The global Relative Analgesia Machine market size was estimated at USD 82.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
