Abstracts

A relay is an electrically operated switch. It consists of a set of input terminals for a single or multiple control signals, and a set of operating contact terminals. The switch may have any number of contacts in multiple contact forms, such as make contacts, break contacts, or combinations thereof. Relays are used where it is necessary to control a circuit by an independent low-power signal, or where several circuits must be controlled by one signal. Relays were first used in long-distance telegraph circuits as signal repeaters: they refresh the signal coming in from one circuit by transmitting it on another circuit. Relays were used extensively in telephone exchanges and early computers to perform logical operations. The traditional form of a relay uses an electromagnet to close or open the contacts, but other operating principles have been invented, such as in solid-state relays which use semiconductor properties for control without relying on moving parts. Relays with calibrated operating characteristics and sometimes multiple operating coils are used to protect electrical circuits from overload or faults; in modern electric power systems these functions are performed by digital instruments still called protective relays. Core global Relay manufacturers include Xiamen Hongfa Electroacoustic, Omron and TE Connectivity. The top three companies have about 37% of the market. Asia Pacific is the world's largest Relay market with a market share of about 47%, followed by Europe and North America with a market share of 25% and 17%, respectively. In terms of product type, Electromechanical Relay is the largest segment with approximately 58% market share. In terms of application, Automobile is the largest downstream segment, accounting for about 31% of the market.

The global Relay market size was estimated at USD 8610.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.70% during the forecast period.
