Report Overview

Remote bimetallic thermometer is a temperature measuring instrument used to measure temperature in remote or difficult to reach locations. It consists of a bimetallic sensor connected to a long rod or probe, which can be inserted into the process or location where temperature needs to be measured. The bimetallic sensor is composed of two metal strips which are combined together. Each metal strip has a different coefficient of thermal expansion. As the temperature changes, these two metals expand and contract at different rates, causing the sensor to bend. The bending amount is proportional to the temperature and is used to determine the temperature at the measurement location. Remote bimetallic thermometers are typically used for industrial applications where temperature measurement is crucial for safety and process control. They are typically used for applications that require temperature measurement at remote locations, such as in pipelines or containers, or in difficult to access locations. There are various types of remote bimetallic thermometers, including adjustable angle, fixed angle, and direct installation. Each type of thermometer has its own advantages and disadvantages, and the choice of thermometer will depend on the specific application and location being measured.
