Report Overview:

Browser isolation is a virtualization technique that moves browser execution from the user device to a secure environment -- either locally on the user device or remotely in the cloud (Remote Browser Isolation (RBI)). In this way, browser activity is isolated from the user, preventing any attempts at malware infection through web-based attacks. Browser isolation takes a completely different approach to Web security than traditional network security solutions. Typically, security solutions require a list of known attacks and suspicious activity in order to identify threatening Web content and block access to it. Web quarantine technology protects any Web content within a remote endpoint, sanitizes it, and sends the secure content to the user's local browser. As a result, users can access content while being protected, even from zero-day attacks. This security technique is particularly useful for protecting employees who work with highly sensitive data, such as government, medical, banking or military records.

The Global Remote Browser Isolation Market Size was estimated at USD 450.08 million in 2023 and is projected to reach USD 2202.72 million by 2029, exhibiting a CAGR of 30.30% during the forecast period.
