Report Overview

Remote controlled improvised explosive devices (RECD) Jammers are specialized electronic devices used for countering and neutralizing the threat posed by remote-controlled explosive devices, also known as improvised explosive devices (IEDs).

These jammers are designed to disrupt the communication signals between the remote control and the explosive device, preventing the remote control from detonating the IED. RECD jammers utilize various techniques, such as radio frequency (RF) interference, to jam or block the signals used by the remote control to activate the explosive device.

The RECD jammer system typically consists of a transmitter unit and receiver unit. The transmitter unit emits a strong radio frequency signal in the frequency band used by the remote control, effectively overpowering or interfering with the control signal. The receiver unit detects and analyzes the incoming control signals, ensuring dynamic jamming and adapting tactics to counter different types of remote control devices and signal variations.

The purpose of RECD Jammers is to neutralize the threat posed by remote-controlled explosive devices and provide a safer environment for military operations, law enforcement, and civilian populations. They play a critical role in counter-terrorism efforts and in protecting personnel and infrastructure against remote-controlled attacks.
