Abstracts

Remote pressure difference transmitter is an instrument used to measure the pressure difference between two points during the process. It consists of a pressure sensor and a transmitter that sends signals to the control system or monitoring equipment. Differential pressure measurement can be used to infer flow rate, liquid level changes, or other process variables. The 'remote' aspect of a transmitter refers to the fact that the sensor and transmitter can be physically separated from each other, providing greater flexibility in installation and monitoring. For example, sensors can be installed in pipelines or tanks, while transmitters are located in control rooms or other safe locations.

The global Remote Differential Pressure Transmitter market size was estimated at USD 315.42 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.85% during the forecast period.
