Report Overview

Renal Colic is a symptom of urinary stones. Renal colic is pain that occurs due to a stone in the urinary tract. The stone stretches the surrounding area of the tissue while trying to pass through, which can be painful. A stone can cause obstruction and hydronephrosis of the ureter, decreasing the rate of ureteral peristalsis, and causing urine to back up into the kidney. As the stone migrates distally and approaches the bladder, the patient may experience dysuria, urinary frequency, urgency, or difficulty in urination. Diagnosis is made through a combination of history and physical exam, laboratory, and imaging studies. Basic metabolic panel (BMP) should be obtained to assess for renal function, dehydration, acid-base status, and electrolyte balance. Symptoms of renal colic include pain in the back, side or groin, blood in the urine, abnormally colored urine, fever, chills, and nausea with or without vomiting. The management of renal stones is by a professional team that consists of a nephrologist, emergency department physician, radiologist, urologist, and a primary care provider.

The global Renal Colic Treatment Equipments market size was estimated at USD 245.6 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.85% during the forecast period.
