Abstracts

Renal denervation catheters are minimally invasive medical devices designed to treat resistant hypertension by disrupting the sympathetic nerves surrounding the renal arteries, thereby reducing excessive nerve signals that contribute to high blood pressure. These catheters are typically advanced through the femoral artery and use various energy modalities such as radiofrequency, ultrasound, or chemical agents to ablate targeted nerve tissues while sparing the arterial wall and surrounding structures. The procedure aims to provide a long-term reduction in blood pressure for patients who do not respond adequately to antihypertensive medications, positioning renal denervation as an innovative interventional approach in the management of hypertension.

The global Renal Denervation Catheters market size was estimated at USD 450.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 12.50% during the forecast period.
