Abstracts

Rendered poultry products are derived from the processing of poultry by-products, such as fats, bones, offal, and feathers, through a heating and separation process to yield valuable materials like poultry fat (yellow grease) and poultry meal. This process recovers usable resources from parts of the bird not destined for human consumption, transforming waste into economically significant commodities. These products are integral to various industries, serving as high-energy ingredients in animal feed, particularly for poultry, swine, and aquaculture, due to their protein and fat content. Additionally, they find applications in pet food, biofuels, oleochemicals, and even fertilizers, making rendering an essential component of sustainable agribusiness by minimizing waste and maximizing resource efficiency.

The global Rendered Poultry Products market size was estimated at USD 380.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
