Abstracts

Renewable aviation fuel, also known as sustainable aviation fuel (SAF), refers to liquid fuel produced from sustainable feedstocks such as waste oils, agricultural residues, non-food biomass, or captured carbon that meets stringent technical and sustainability criteria to serve as a drop-in replacement for conventional jet fuel without requiring modifications to aircraft engines or fuel infrastructure. It is characterized by significantly lower lifecycle greenhouse gas emissions compared to fossil-based jet fuel and is certified under international standards like ASTM D7566 to ensure compatibility, safety, and performance. The production pathways include hydroprocessed esters and fatty acids (HEFA), Fischer-Tropsch synthesis, alcohol-to-jet, and power-to-liquid processes, with the common goal of decarbonizing air travel while maintaining operational reliability.

The global Renewable Aviation Fuel market size was estimated at USD 5780.42 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
